Boxer Inu

INTRODUCTION

If we take a closer look at blockchain, the crypto market, the famous decentralized finance (DeFi) protocols: we are actually seeing FIAT being replaced with crypto and the large steps taken towards the development of a permissionless, transparent, immutable, secure, and fully autonomous global digital economy. This development will allow us to differentiate between the virtual and physical, FIAT currency and digital currency, and real-world use cases and dapps. This development will pave the way towards a digital economy that will overcome financial, technological, and societal problems.

Dogecoin was originally created at least in part as a lighthearted joke for crypto enthusiasts and took its name from a once-popular meme. Despite this unusual origin story, it has exploded in popularity in 2021, becoming the fifth-largest cryptocurrency by market cap. Today Dogecoin is no joke, having exploded in value and gained more than 5,000% in 2021. Among its boosters is Tesla CEO Elon Musk, who called Dogecoin his favorite cryptocurrency. Musk also named Dogecoin the “people’s crypto,” and promised to plant a physical Dogecoin token on the moon. The original point of Dogecoin might have been to just have fun, but for investors, having fun means making money.

Following its success and a little before that, a lot of tokens launched on the Ethereum and the Binance Smart Chain, all promising to rebuild financial services and make them available to anyone. These tokens created a new era in the history of Blockchain creating a whole community of millions with the same interests in similar meme coins and shitcoins projects.

As Ethereum gas fees were high and there was an alternative to Ethereum available with the same features which used the Ethereum Virtual Machine (EVM), meme coins started to launch on the Binance Smart Chain (BSC), making BSC a powerful medium for investment and transactions as it allowed transactions to be done immediately with lower costs.

However, meme coins and shit coins have taken this development for granted and developers and project owners are launching actual shitty projects with zero use cases and zero utility and getting too much traction. We think projects should not be invested in until they have a lot of use cases and applications of their tokens. This is why we are launching Boxer Inu, a meme coin with the actual use case and a catchy and trendy name.

Boxer Inu will be a deflationary, auto-liquidity generating, static rewarding token on the Binance Smart Chain. Apart from this Boxer Inu will also have the donation function in its contract through which 2% fees will be cut and sent for important causes.

Unlike other meme tokens out there that serve only one purpose; pump and dump, Boxer Inu has actual use cases and applications for its utility token \$BOXER.

Some utilities include an NFT Marketplace, a decentralized exchange, Boxer Lottery, and a crypto gaming platform that will all launch as soon as in 3 months at different time intervals. After this comes a launchpad platform that will compete with platforms like DxSale and BSCPad.

All these features are mentioned on the roadmap and under development. As you will see as you read through this White Paper

Boxer Inu also has a perfect tokenomics and token distribution model that aims to take Boxer to the moon like its predecessors with the same Inu name

DISCLAIMER: DYOR

Automatic Liquidity Generation Mechanism

In many DeFi projects, we have seen a lot of investors jump in and buy a large number of assets, causing a huge uproar, a lot of pumps that we all like to see. And once the graph becomes more vertical rather than horizontal (starts going up), an increasing number of common traders also start investing too. We've all been there and seeing a colorful graph that is just heading up, it can be pretty damn hard not to jump in. However, almost always, the token suffers an impending collapse of the price.

Once the bandwagons are full and the big holders sell, the graph sees a downward plunge and the common trader suffers a great loss.

Now, what is the reason behind such a big loss to price?

You know how liquidity pools store a pair of assets, the token, and another currency (mostly BNB on BSC). When the pool loses a lot of BNB, the price of the other token shoots down. This causes a loss of value and those scary graphs we talked about.

This effect increases in a smaller liquidity pool and decreases as the liquidity pool increases in both tokens. This is the reason why we have integrated an automatic liquidity generating function that not only solves the high price variation problem but also strengthens Boxer Inu's future.

The Automatic Liquidity Generation feature within \$BOXER's smart contract is recently very popular, yet very innovative core module that the protocol has implemented. It involves a feature that, on every transaction, causes a certain percentage of the trade's value to automatically generate liquidity in PancakeSwap liquidity pools.

This mechanism benefits in two distinct ways: first, the constant supply of liquidity into the pool solidifies its future as the removal of tokens from that pool will not cause a huge variation to the price. Second, a specific percentage of tax is cut on each transaction, this disincentivizes the user to sell as he will receive a lesser value when he sells causing him to hold until a large increase is seen.

We have put a 3% fee that can be changed as the community demands, the fee is split 50/50, half is swapped by the contract into BNB, while the other half of the tokens are paired automatically with the previously mentioned BNB and added to the liquidity pair on Pancake Swap.

RFI Mechanics

What is RFI? RFI also called Reflection or static rewards is a function that causes a certain percentage of tax on each transaction to automatically be sent to holders of the tokens.

Now here's a better upside to holding \$BOXER.

If you just hold \$BOXER in your wallet you become eligible to receive more tokens without any limit of holding period. The more you hold the more you receive. The longer you hold onto it the more you can actually earn. This is because 3% of transaction fees from trades and transfers of %BOXER will get redistributed amongst the token holders.

As the token transactions per day increase so will the static reward amount and hodlers/believers of the project and token can earn just by believing.

Static Rewards solve a range of problems. First, the size of the reward is determined by the number of tokens traded. Second, each holder receives a portion of each dump and pump's value through this process. Third, this system allows token holders to retain their tokens to gain a higher value when they sell them (they will have more tokens than they bought).

As a result, each transaction is subject to 3% fees for static rewards, which are immediately distributed to all holders based on their holding volume, all without the need for farming or staking!

As users execute transactions, the number of tokens in your wallet will continue to grow indefinitely. This successfully avoids impermanent loss, and you are effectively compensated for simply holding \$BOXER.

Deflationary Mechanics - Burning

Burning is a deflationary approach to control the supply of a token which works by constantly removing assets from circulation. Burning of \$BOXER will be an automatic process that Boxer Inu's devs have implemented by adding a function that allows each transaction to cut a specific cut (1%) and sends this amount of tokens to the burn address, effectively decreasing the supply shown on explorers too.

Developers use deflationary burning mechanisms to increase the value of tokens thereby avoiding inflation. Because of the way early DeFi platforms distributed LP and reward tokens, they experienced inflationary issues. Through this function, \$BOXER's supply will gradually delete a portion of the tokens in circulation in order to decrease its supply.

Donation/Charity

Being a DeFi project, Boxer Inu aims to also give some attention towards helping those in need with our protocol. While we, our investors, our holders and the community are focusing on the longevity, growth and development of the project, we also need to do some good for the world we live in. Therefore, Boxer Inu's mission is to open more and more ways through which donations can be given for important causes while we do our transactions.

To accomplish this, the team has integrated a function in \$BOXER's smart contract that will allow 2% fee to be cut on each transaction and sent forward to a charity wallet which will hold all funds. The community will be urged to vote and give their opinion on the allocation of these funds for righteous causes whether they be of helping the poor or needy, endangered animals, combating climate change or any other reated matter.

Boxer Inu also has plans to hold crowdfunding schemes for larger causes. All the funds will be sent to a charity wallet and when it has the right amount raised, all contributions and donations will be made in a secure and transparent way.

The charity wallet's address will be shared by the team so that the community can check through blockchain explorers where their donations go.

Use Cases. What's Next?

Boxer Inu differs from the rest of the meme crowd because it has a passionate team working full time to develop a fully-fledged ecosystem of applications surrounding the token. Our mission is to not only drive a marketing and development campaign appealing to cryptocurrency asset traders for the short term but also a suitable long-term plan for hodlers and serious long-term crypto enthusiasts active in the crypto sphere.

Boxer protocol will offer a variety of cryptocurrency dapps all with the goal to accelerate the adoption of our protocol and help play a leading role in changing the way people conduct financial transactions. Dapps that will accelerate the growing process:

1. Boxer NFT Marketplace
2. Boxer DEX
3. Boxer Lottery
4. Boxer Crypto Gaming
5. Boxer Launchpad

- An NFT Marketplace

A marketplace for all kinds of digital assets and crypto collectibles. Users can trade, buy, sell, auction, bid, and discover digital art and assets. Content creators will be allowed to produce their own NFTs on the blockchain using Boxer Inu's NFT minting feature. There is no need for content creators to have any programming knowledge to make collections and NFTs.

Apart from this, Boxer will employ a bunch of artists and upload its own content for sale to the public. We will create and sell NFTs and the money generated from these activities will be donated to charities.

Users who are selling content or NFTs can sell an item for a fixed price, create a declining price listing, or make an auction listing.

All kinds of content will be welcomed whether they are images, photos, digital art, music files, 3d models, movies, concert hostings, books, or videos.

This provides artists complete control over their careers, allowing them to achieve their goals without having to pay a large fee to larger agencies. The Binance Smart Chain (BEP-20) utility token for this NFT marketplace allows artists and producers can turn their ideas into NFTs, mixing music, art, and gaming with collectible NFTs.

The Boxer Inu NFT marketplace will be powered by the Boxer Inu token (\$BOXER) meaning that all transactions will be made through this token. Each artist will be provided with BOXER tokens.

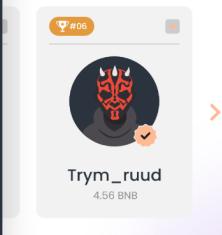

CREATE, EXPLORE & COLLECT DIGITAL ART NFTS.

- A Decentralized Exchange

Boxer Inu intends to launch a decentralized exchange, yield farming, and a staking platform in the same application.

The DEX will be working on the Automated Market Maker (AMM) algorithm much like Uniswap, PancakeSwap, and BakerySwap.

The DEX will be launched on the Binance Smart Chain and will introduce a new era where meme coins will be launched as credible projects and putting a stop to the disgraceful name people give to these protocols.

The Boxer Inu DEX will be much like PancakeSwap, the swapping protocol Boxer Inu will be initially listed on. Boxer Inu's DEX will allow users to add liquidity to the protocol, earn lp tokens for their contribution, and get great rewards for providing liquidity.

THE ROADMAP

The development and marketing teams at \$BOXER are currently focusing on the key activities that are needed for hyper-growth. The following is a high-level roadmap that can change as new directions are proposed by the Boxer Inu community:

AUDITED BY TECHRATE

TechRate was commissioned by Boxer Inu to perform an audit of Boxer Inu's token smart contract. The link to the contact is given below:

[https://bscscan.com/
token/0x192E9321b6244D204D4301AfA507EB29CA84D9ef](https://bscscan.com/token/0x192E9321b6244D204D4301AfA507EB29CA84D9ef)

The purpose of the audit was to achieve the following:

1. Ensure that the smart contract functions as intended.
2. Identify potential security issues with the smart contract.
